

AMENDMENTS TO THE CLAIMS

1. (Cancelled).

2. (Currently amended) A hydraulic punch as defined in claim 4 †, wherein said hydraulic pump section can be rotated 360 degrees about said elongated flexible hydraulic hose.

3. (Currently amended) A hydraulic punch as defined in claim 4 †, wherein said hydraulic pump section includes a reservoir for storing hydraulic fluid, said hydraulic fluid capable of moving from said reservoir of said hydraulic pump section, through said hydraulic pump section, through said elongated flexible hydraulic hose, and into said hydraulic ram section.

- A/C
Cont*
4. (Currently amended) A hydraulic punch as defined in claim 1, wherein comprising:
a hydraulic ram section, said hydraulic ram portion section comprises: including,
a housing having a passageway extending therethrough;
a ram positioned within said passageway of said housing, said ram capable of
sliding within said passageway of said housing, said ram dividing said passageway of said
housing into a first chamber and a second chamber, said ram having a bore therethrough
which extends from said first chamber to said second chamber;
a retainer connected to said housing for closing an end of said passageway,
said retainer having an opening therethrough; and
a normally expanded spring positioned within said second chamber between
said ram and said retainer;
a hydraulic pump section; and
an elongated flexible hydraulic hose connected between said hydraulic ram section
and said hydraulic pump section, said elongated flexible hydraulic hose permitting movement
of said hydraulic ram section relative to said hydraulic pump section.
5. (Original) A hydraulic punch as defined in claim 4, wherein said ram has a cavity
therein for connection of a draw stud thereto.
6. (Currently amended) A hydraulic punch as defined in claim 4, wherein said bore
extending through said ram has a first portion which is aligned with a central axis of said ram
and an a second portion which is radial to said central axis of said ram.
7. (Cancelled).

Count

8. (Currently amended) A hydraulic punch as defined in claim 1, wherein comprising:

a hydraulic ram section;

a hydraulic pump section, said hydraulic pump section comprises: including,

a pump block having a first bore extending therethrough, and a second bore extending at an angle to said first bore;

a plunger housed within said second bore of said pump block;

a first handle having a reservoir therein for storing hydraulic fluid, said reservoir being in communication with said first bore of said pump block such that said hydraulic fluid can move into said first bore of said pump block; and

a second handle attached to said plunger and to said pump block, said second handle capable of being moved from a first position to a second position in order to move said plunger within said second bore of said pump block, said movement of said plunger within said second bore of said pump block causing said hydraulic fluid to move from said reservoir to said first bore of said pump block; and

an elongated flexible hydraulic hose connected between said hydraulic ram section and said hydraulic pump section, said elongated flexible hydraulic hose permitting movement of said hydraulic ram section relative to said hydraulic pump section

9. (Original) A hydraulic punch as defined in claim 8, wherein said hydraulic pump section further includes a coupler attached to said pump block, said coupler being attached to said elongated flexible hydraulic hose.

10. (Original) A hydraulic punch as defined in claim 9, wherein said hydraulic pump section further includes a plate securing said coupler to said pump block.

A /
11. (Original) A hydraulic punch as defined in claim 10, wherein said pump block can be rotated 360 degrees about said coupler.

12. (Currently amended) A hydraulic punch as defined in claim 8 †, wherein said hydraulic ram section is capable of being rotated from 0 degrees to an ~~an~~ angle greater than 90 degrees relative to said hydraulic pump section as said elongated flexible hydraulic hose is capable of bending from 0 degrees to an angle greater than 90 degrees.

13. (Cancelled).

14. (Currently amended) A hydraulic punch ~~as defined in claim 13, wherein comprising:~~ a hydraulic ram section; a hydraulic pump section; an elongated flexible hydraulic hose connected between said hydraulic ram section and said hydraulic pump section, said elongated flexible hydraulic hose permitting movement of said hydraulic ram section relative to said hydraulic pump section; and a hose cover, said elongated flexible hydraulic hose being generally encapsulated within said hose cover, said hose cover prevents said elongated flexible hydraulic hose from being flexed at an angle greater than approximately 90 degrees relative to said hydraulic pump section such that said hydraulic ram section cannot move more than 90 degrees relative to said hydraulic pump section.

15. (Cancelled).

A/
Canc

16. (Currently amended) A hydraulic punch as defined in claim 22 +5, wherein said hydraulic pump section can be rotated 360 degrees about said flexible connecting means.

17. (Currently amended) A hydraulic punch as defined in claim 22 +5, wherein said flexible connecting means is an elongated flexible hydraulic hose.

18. (Original) A hydraulic punch as defined in claim 17, further including a first hydraulic hose connector at an end of said elongated flexible hydraulic hose and connected to said hydraulic ram section, a second hydraulic hose connector connected to an opposite end of said elongated flexible hydraulic hose, and said hydraulic pump section including a coupler connected to said second hydraulic hose connector.

19. (Currently amended) A hydraulic punch as defined in claim 22 +5, wherein said hydraulic pump section includes a reservoir for storing hydraulic fluid, said hydraulic fluid capable of moving from said reservoir of said hydraulic pump section, through said hydraulic pump section, through said flexible connecting means, and into said hydraulic ram section.

20. (Currently amended) A hydraulic punch as defined in claim 22 +5, wherein said hydraulic ram section is capable of being rotated from 0 degrees to an angle greater than 90 degrees relative to said hydraulic pump section as said flexible connecting means is capable of bending from 0 degrees to an angle greater than 90 degrees.

21. (Cancelled).

A / *Cancelled*

22. (Currently amended) A hydraulic punch as defined in claim 21, wherein comprising:
a hydraulic ram section;
a hydraulic pump section;
flexible means for connecting said hydraulic ram section and said hydraulic pump
section, said flexible connecting means permitting movement of said hydraulic ram section
relative to said hydraulic pump section; and
means for protecting said flexible connecting means from damage, said protecting
means is a hose cover, said elongated flexible hydraulic hose being generally encapsulated
within said hose cover, said hose cover preventing said flexible connecting means from
flexing to an angle greater than 90 degrees relative to said hydraulic pump section.
